BKL SF-1 3/7/06

PATENT

## In the Claims:

1. (Original) A flashlight comprising:

a lamp;

a power storage element;

a switch;

an electronic controller;

the controller having a switch input connected to the switch;

the controller being operable in response to the input to deliver power from the power storage element to the lamp; and

the flashlight having an elongated housing having the lamp at a first end and the switch at an opposed second end, and including at least two independent electrical paths between the first and second ends.

- 2. (Original) The flashlight of claim 1 wherein the switch is operably connected directly to the switch input.
- 3. (Original) The flashlight of claim 1 wherein the controller, lamp, and power storage element are connected to each other via a power circuit bypassing the switch, such that current for illuminating the lamp does not pass through the switch.
- 4. (Original) The flashlight of claim 1 wherein the switch is operable within a range of conditions and is operable to transmit an electrical state corresponding to a condition to the controller.
- 5. (Original) The flashlight of claim 1 wherein the switch has a plurality of different electrical states in addition to an off state, and wherein the electrical state is based on a degree of externally applied force.
- 6. (Original) The flashlight of claim 5 wherein the switch includes a plurality of separate contact elements each connected to a respective electrical component, and all operable to

BKL SF-1 3/7/06

PATENT

contact a common contact sequentially in response to movement of a switch actuator, such that the number of separate contacts contacting the common contact is based on the degree of applied external force.

- 7. (Original) The flashlight of claim 6 wherein the switch includes at least a resistor, and the electrical states include a plurality of different resistance values.
- 8. (currently amended) A flashlight comprising:
  - an electronic controller;
  - a lamp connected to the controller:
  - a power storage element connected to the controller;
  - a switch electrically connected to the controller;

the switch being operable within a range of conditions and is operable to transmit an electrical state corresponding to a condition to the controller;

the switch having a plurality of different electrical states in addition to an off state, and wherein the electrical state is based on a degree of externally applied force; and wherein the switch is biased to the off state.

- 9. (Original) The flashlight of claim 8 wherein the switch includes a plurality of separate contact elements each connected to a respective electrical component, and all operable to contact a common contact sequentially in response to movement of a switch actuator, such that the number of separate contacts contacting the common contact is based on the degree of applied external force.
- 10. (Original) The flashlight of claim 9 wherein the switch includes a resistor network, and the electrical states include a plurality of different resistance values.
- 11. (Original) A flashlight comprising:
  - a lamp;
  - a power storage element;

BKL SF-1 3/7/06

PATENT

a switch;

an electronic controller connected to each of the power storage element, the lamp, and the switch;

the controller operable to provide momentary illumination of the lamp during an application of a first degree of force, and to cease illumination of the lamp in response to cessation of the force; and

the controller operable to provide sustained illumination of the lamp in response to application of a greater second degree of force, and to maintain illumination of the lamp in response to cessation of the force.

- 12. (Original) The flashlight of claim 11 wherein the controller is operable while providing sustained illumination after cessation of the force to cease illumination in response to a second application of force.
- 13. (Original) The flashlight of claim 11 wherein the switch includes a plurality of contacts, at least one of which having an associated resistor connected to present a net resistance to the controller based on the degree of force applied to the switch.
- 14. (Previously presented) A flashlight comprising:
  - a lamp with a variable light output level up to a maximum output level;
  - a switch operable through a range of conditions ranging between a released position and a fully actuated condition;
    - a power storage element;
  - a dimmer facility operable to select a dimmed output level below the maximum output level;

an electronic controller operably connected to each of the lamp, the switch, the power storage element, and the dimmer facility;

the controller operable to provide illumination of the lamp at the dimmed output level in response to an application of a first degree of force on the switch;

BKIL SF-1 3/7/06

PATENT

the controller operable to provide illumination of the lamp at the maximum output level in response to application of a greater second degree of force on the switch.

- 15. (previously presented) The flashlight of claim 14 including in response to application of the first degree of force for less than a selected duration, sustaining illumination of the lamp at the dimmed output level after cessation of the force.
- 16. (Canceled).
- 17. (currently amended) A method of operating a flashlight having a light source with variable light output up to a maximum output level, a first control operable to establish an intermediate dimmed level, and a separate switch operable through a range of conditions ranging between a released position and a fully actuated condition, the method comprising:

  operating the first control to establish establishing a dimmed level at an output less than the maximum level;

in response to actuating the switch to an intermediate condition between the released position and the fully actuated position by maintaining a first degree of force, illuminating light source at the dimmed level;

in response to actuating the switch to the fully actuated condition by maintaining a second degree of force greater than the first degree of force, illuminating the light source at the maximum level; and

in response to cessation of force ceasing illumination of the light source.

- 18. (previously presented) The flashlight of claim 8 wherein the switch is located at an end of the flashlight opposite the lamp.
- 19. (previously presented) The flashlight of claim 14 wherein the controller is operable to maintain the lamp in an off state in the absence of an application of force.
